

KEYTRUDA (pembrolizumab) - HCP Promotional Material

KEYTRUDA reduces mortality by 30% in patients with advanced non-small cell lung cancer compared to standard chemotherapy.

In clinical trials, KEYTRUDA demonstrated a significant improvement in overall survival, with a median OS of 30 months versus 14.2 months for chemotherapy alone.

KEYTRUDA is well-tolerated with minimal side effects. The most common adverse reactions are fatigue, nausea, and decreased appetite.

KEYTRUDA is indicated for first-line treatment of patients with metastatic non-small cell lung cancer (NSCLC) whose tumors have high PD-L1 expression.

Ask your patients about KEYTRUDA ? the #1 prescribed immunotherapy for advanced NSCLC.
